

601.220 Intermediate Programming

Spring 2023, Day 16 (Feb 27th)

Today's agenda

- Exercise 15 review
- Linked lists
- Exercise 16

Reminders/Announcements

→ HW4: due Friday (Mar 3rd) (no late subs)

- Midterm project

→ • Will be posted on course website Wednesday (Mar 1st)

- Due Friday, Mar 17th (no late submissions)

- Expect an email soon if you have not registered a team (you will be assigned a partner) ⇒ these emails have been sent

- Midterm exam

→ • In class Friday, March 10th

- Review materials are available on course website

Exercise 15 review

```
(gdb) break endian.c:21
Breakpoint 1 at 0x1243: file endian.c, line 21.
(gdb) run
[...output omitted...]
Breakpoint 1, main () at endian.c:21
21     printf("%u\n", *p);
(gdb) print/x ((unsigned char *)p)[0]
$1 = 0x83
(gdb) print/x ((unsigned char *)p)[1]
$2 = 0x7e
(gdb) print/x ((unsigned char *)p)[2]
$3 = 0xa3
(gdb) print/x ((unsigned char *)p)[3]
$4 = 0x38
```

In base-16, 950238851 is 38A37E83. Since we're seeing the bytes in order from least to most significant, the ugrad machines are *little endian*.

Exercise 15 review

To negate a two's complement value:

- Invert all of the bits (the `~` operator is useful for this)
- Add 1

Exercise 15 review

$(1U \ll 31)$

Note that `0x80000000U` is the unsigned int value with only the most significant bit set to 1. This is the sign bit, and values with this bit set are negative.

```
unsigned int magnitude(unsigned int value) {  
    if ((value & 0x80000000U) == 0U) {  
        return value; // value is non-negative  
    }  
  
    // value is negative, so invert bits and add 1  
    value = ~value; // invert bits  
    value += 1U; // add 1  
    return value;  
}
```

Exercise 15 review

Generating a uniformly distributed pseudo-random integer in the range 0 (inclusive) to max_num (exclusive):

```
int gen_uniform(int max_num) {  
    return rand() % max_num;  
}
```

Generating 500 random values in range 0 (inclusive) to max_range (exclusive) and tallying them in the hist array:

```
for (int i = 0; i < 500; i++) {  
    hist[gen_uniform(max_range)]++;  
}
```

Exercise 15 review

Generating normally-distributed integer values in the range 0 (inclusive) to `max_range` (exclusive):

```
int normal_rand(int max_num) {  
    int result = 0;  
    for (int i = 1; i < max_num; i++) {  
        if ((rand() & 1) == 1) {  
            result++;  
        }  
    }  
    return result;  
}
```

This is basically flipping a coin `max_num-1` times and counting how many times it's heads.

Exercise 15 review

Generating 500 normally-distributed values in the range 0 (inclusive) to `max_range` (exclusive) and tallying them in the `hist` array:

```
for (int i = 0; i < 500; i++) {  
    hist[normal_rand(max_range)]++;  
}
```

Day 17 recap questions

- ① Describe the linked list structure by a diagram.
- ② Compare arrays and linked lists. Write down their pros and cons.
- ③ What is a linked list's head? How is it different from a node? Explain.
- ④ How do you calculate `length` of a linked list?
- ⑤ How do you implement `add_after` on a singly linked list?

1. Describe the linked list structure by a diagram.

struct Node type:

```
struct Node {  
    char payload; // payload could be any data type  
    struct Node *next;  
};
```

recursive!

Example linked list

```
// code creating a linked list
struct Node *head = malloc(sizeof(struct Node));
head->payload = 'A';
head->next = malloc(sizeof(struct Node));
head->next->payload = 'B';
head->next->next = malloc(sizeof(struct Node));
head->next->next->payload = 'C';
head->next->next->next = NULL;
```

A more concise representation

2. Compare arrays and linked lists. Write down their pros and cons.

Sequences

Arrays:

- Pro: $O(1)$ access to arbitrary element
- Con: $O(N)$ to insert or remove element at arbitrary position
- Pro: better locality (fewer cache misses when iterating)
- Pro: more compact
- Con: fixed size, to reallocate must allocate new array and copy existing data

Linked list pros and cons

Linked list:

- Con: $O(N)$ access to arbitrary element
- Pro: $O(1)$ to remove element at arbitrary position
- Con: worse locality (more cache misses when iterating)
- Con: less compact (next pointers require space)
- Pro: can grow incrementally, nodes are allocated one at a time

3. What is a linked list's head? How is it different from a node? Explain.

Contrast: head pointer vs. head node. The head pointer is a pointer variable storing a pointer to the first node. The head node *is* the first node in the linked list.

Picture:

4. How do you calculate length of a linked list?

A loop is required:

```
struct Node *head = /* points to first node */;  
int count = 0;  
  
for (struct Node *cur = head; cur != NULL; cur = cur->next) {  
    count++;  
}
```

"advance"

5. How do you implement add_after on a singly linked list?

pointer to arbitrary node

```
void add_after(struct Node *p, char value) {  
    struct Node *n = malloc(sizeof(struct Node));  
    n->payload = value;  
    n->next = p->next;  
    p->next = n;  
}
```

Exercise 17

- Basic linked list functions
- Drawing pictures to reason about how linked lists operations should work is very helpful!
- Note that `reverse_print` is most easily implemented using recursion
- Talk to us if you have questions!
